My Desk

Init	Module	Sub Module	Title	Description/ Steps to reproduce	Type	Expected result	Actual Result	Image/Video	Priority	Status	Reported By	Attachment	Remarks	
						The application should separate internal team workflows from external business contacts to ensure a clear layout.								
	People		Suggestion to Rename the "People" Module for Better Clarity and Professional UI.	Currently, the application has a single module named "People" that manages three different types of users: Employees, Customers, and Suppliers. Combining internal staff and external business contacts under one general name can confuse the user. To improve the user experience (UX) and make the application look more professional, it is recommended to separate or rename this module so users can easily understand its purpose.		Internal staff management (Attendance, Payroll, HR) should be placed under a module named "HR" or "Employees". External business entities (Customers and Suppliers) should be placed under a module named "Contacts" or "Directory". The navigation titles should be simple and easy for any business user to understand instantly.	Currently, Employees, Customers, and Suppliers are all mixed together under a single module named "People". The term "People" is too vague and does not clearly show that financial business contacts (like suppliers and customers) are managed inside it.		Medium				
	People	Add Employee	Missing Inline Error Messages for Required Fields on "Add Employee" Form	When a user tries to save or submit the "Add Employee" form without entering data into the required fields, the system does not show any inline error messages.		The system should validate all mandatory fields before submitting the form.	No inline error messages are displayed when required fields are left blank.		Medium					
			Non-Professional Validation Message When Password and Confirm Password Do Not Match	On the "Add Employee" form, the password validation works, but the error message is unprofessional when passwords do not match in unprofessional and lacks proper formatting.		When the "Password" and "Confirm Password" fields do not match, a professional inline error message should be displayed. The message should clearly state the issue using standard phrasing, such as: "Passwords do not match." or "The confirm password does not match the chosen password."	The system detects the mismatch, but the validation message shown to the user looks unprofessional and does not follow standard UI guidelines.		Low				
	Customer	Add customer	Missing Inline Error Messages for Required Fields on "Add Customer" Form.	When a user tries to save or submit the "Add Customer" form without entering data into the required fields, the system does not show any inline error messages.		The system should validate all mandatory fields before submitting the form.	No inline error messages are displayed when required fields are left blank.		Medium				
			Button Size Increases and Causes Layout Shifting During "Saving" and "Updating" States	When clicking the "Save" or "Update" buttons, the system correctly changes the text to "Saving" or "Updating", but the button's width increases. This expands horizontally to fit the longer text, which alters the form alignment and causes layout shifting.		The button should have a fixed width or enough padding from the start so that changing the text does not alter its structural size.	The button grows wider when the text changes to "Saving" or "Updating", disrupting the UI alignment.		Low				
			Form Models Open Automatically When Switching Between Navigation Tabs	There is an issue with modal state persistence when navigating through the application tabs. For example, switching from the "Customer" tab to "Supplier" automatically opens the "Add Customer" modal unintentionally. Similarly, navigating from "Supplier" to the "Customer" tab automatically opens the "Add Customer" modal.		The application should load the default list view of a module when a user switches tabs	Switching between tabs triggers the creation models to open automatically without any user interaction, forcing the user to close them manually.		Medium				
		Add Supplier	Missing Inline Error Messages for Required Fields on "Add Supplier" Form.	When a user tries to save or submit the "Add Supplier" form without entering data into the required fields, the system does not show any inline error messages.		The system should validate all mandatory fields before submitting the form.	No inline error messages are displayed when required fields are left blank.		Medium				
		Delete Modal	Redesign of the Delete Confirmation Modal for "My Desk"	The current delete confirmation modal functions correctly but requires design and text updates to look polished, professional, and consistent with SaaS UI standards.		The text and warning icon should be perfectly centered inside the modal to create a balanced, symmetrical design.	The body text has an unprofessional gray highlight box behind it. The alignment of the icon, text, and buttons feels uneven. The message text is too simple and does not warn the admin that the action is permanent.		Low					
	Customer	Search	Update Empty Search State Message in Customer Module	When a user searches for something and no results are found, the application should display a consistent message across all modules. Currently, the Customer module does not display the standard empty-state message when a search returns zero results.		When a search in the Customer module returns no results, the system should display the exact global message: "No records available at the moment! Try adjusting your search term."	The Customer module either shows a different message, a blank screen, or an inconsistent text format when a search query finds no matching records.		Low				
	Human Resources		Change Employee Position Field from Text Input to Dropdown Selection	On the "Add/Edit Employee" modal, the Position field is currently a free-text input box where the admin has to type the job title manually.To prevent typos, duplicate entries, and inconsistent data, this field should be easier to fill out. The field needs to be changed to a structured dropdown list.		The "Position" field should be a dropdown menu (select box) instead of a manual text input.	The position field is a standard text input box, forcing the admin to manually type the position every time.		Medium				
			Simplification of HR & Employee Lifecycle Workflows	The current employee management architecture is scattered across three distinct modules/tabs, creating an inefficient user experience (UX): Employee Setup: Used only to create the basic profile. HR Lifeline: Used separately just to assign a designation/position. Withdraw Tab: Used to deactivate an employee, log a reason for leaving, and reactivate them later.		The designation/position field should be a required dropdown integrated directly inside the initial "Add Employee" form. The main Employee data table should feature a clean "Status" column showing whether a staff member is Active or Inactive. To retrieve an employee, the admin should simply click an "Edit" button on the main table, or click the employee name on the main list and select "Deactivate / Terminate"						
			Mismatched Sizing, Alignment, and Drop-Shadow Style on Save and Cancel Buttons	In the "Add Employee" modal footer, the "Save" and "Cancel" buttons suffer from visual inconsistency and poor layout alignment. The "Save" button is significantly smaller than the "Cancel" button, and it has a drop shadow that the "Cancel" button lacks. Meanwhile, the "Cancel" button has a completely different structural weight and lacks an outline or clean separation. This lack of balance looks unprofessional and breaks standard UI component design guidelines.		Both the "Save" and "Cancel" action buttons should have identical dimensions, border-radii, and padding to maintain a uniform structural weight.	The "Save" button is noticeably smaller in size, misaligned vertically, and has an inconsistent button shadow. The "Cancel" button sits higher, lacks uniform structural weight, and does not align cleanly with the primary action button.		Low					
			Vertical Misalignment of Search Placeholder Text and Magnifier Icon	Inside the search field, the text heading/placeholder (e.g., "Search...") and the magnifier icon are not vertically aligned.		The placeholder text and the search magnifier icon should be perfectly aligned along the same horizontal baseline.	The search text heading sits too high or too low, failing to align with the center of the magnifier icon and creating an unaligned UI layout.		Low					
			Leave and Attendance Issues											
	Configuration	Attendance Rules	System defaults set Saturday instead of Sunday when no off-days are selected in Attendance Rules	In the Attendance Rules configuration, if an Admin does not check any box for off days, the system incorrectly marks Saturday ("Sat") as the off day in the attendance list. The default off day should be Sunday.		If no days are selected, the system should default to Sunday as the official off day	The system automatically selects Saturday as the off-day when the checkboxes are left blank. Also, the day name is misspelled as "Sta" in the list UI.		Medium				
	Attendance	Leave	Implement inline error messages and red required asterisks (*) on Leave Form validation	Currently, submitting an empty leave form triggers a single generic alert message: "please fill all required field". To improve user experience and UI consistency, the system should display specific inline error messages under each empty required field, and all required asterisks (*) should be colored red to clearly indicate mandatory inputs. **Steps to Reproduce** 1. Navigate to the Employee Leave Module. 2. Leave all fields completely blank (Employee Name, Leave Subject, First Date, Last Date, Reason). 3. Click the "Save" / "Submit" button. 4. Observe the validation message and the styling of the required fields.		1. The generic alert should be replaced by clear, red inline error messages under each specific missing field (e.g., "Please select an employee name", "Leave subject is required"). 2. All mandatory fields should feature a clearly visible red asterisk (*) next to their labels to signify they are required before submission.	System only displays a single generic alert message: "please fill all required field". The required asterisk (*) does not use the standard red color to visually highlight mandatory fields.		Medium				
	Attendance	Leave	Replace 'Leave Subject' text input with a predefined 'Leave Type' dropdown	Currently, the leave module uses a free-form text field named Leave Subject, allowing employees to type anything manually. To standardize leave tracking, prevent typos, and enable accurate reporting, the system should be updated. It is highly recommended to change this field to a dropdown menu titled Leave Type with predefined corporate leave categories.		1. The field label should be renamed from Leave Subject to Leave Type. 2. The text input box should be replaced with a mandatory dropdown menu containing standard choices (e.g., Sick Leave, Casual Leave, Annual Leave, Unpaid Leave).	The field is currently named Leave Subject. 2. It functions as a text entry field, allowing free-text inputs which leads to messy data, spelling variations, and un-categorized leave logs in the backend database.		Medium (Enhancement)				
	Attendance	Leave	Add Leave Counter and Remaining Balance View	We need to show the total, used, and remaining leaves for each employee based on Leave Type (like Sick Leave and Casual Leave). This will help employees and HR see the leave balance easily.		Add a "Leave Balance" section on the Add Leave form and Detail View. 2. It should show a clean table or summary like this: - Sick Leave: Allowed: 8 | Used: 3 | Remaining: 5 - Casual Leave: Allowed: 10 | Used: 2 | Remaining: 8 3. The numbers should update automatically when a leave is approved.	Currently, there is no option to see the leave count or remaining balance on the screen. Employees do not know how many leaves they have left.		Medium (Enhancement)				
	Attendance	Leave	Form allows users to select a "Last Date" earlier than "First Date" during Add/Apply Leave.	The system does not check date logic when applying for a new leave. A user can successfully save a leave request where the Last Date comes before the First Date (e.g., First Date: July 10, Last Date: July 5). Note: This validation works fine in 'Edit Leave' but is missing in 'Add Leave'.	Bug	The system should block the submission and show an error message like: "Last date cannot be earlier than first date." (The same behavior as the Edit Leave form).	The form saves successfully without any error message, and a broken leave entry is created in the system.		High				
	Attendance	Leave	Duplicate 'Pending' status option appears twice in the Leave Status dropdown on the Edit Leave form	When attempting to edit an existing leave request, the Leave Status dropdown menu shows the option "Pending" two times instead of once.	Issue	The dropdown should show unique status options only once (e.g., Pending, Approved, Rejected). There should be no duplicate options.	The word "Pending" is listed twice in the dropdown list		Low				
	Attendance	Leave	Disable or hide 'Edit' option for Approved or Rejected leave requests	Currently, an employee can still edit and change the leave dates even after the leave is already Approved or Rejected by the Admin. To prevent fraud and maintain data integrity, employees should not be allowed to change dates once a decision is made.	Issue and UI/UX	1. If a leave status is Approved or Rejected, the Edit button should be hidden or disabled. 2. The employee should not be able to change any dates. They can only edit if the status is Pending.	The employee can easily edit and change the dates of approved or rejected leaves, which confuses the HR records.		High				
	Attendance	Employee Attendance	Double-clicking 'Clock In' creates duplicate attendance rows and incorrectly marks employee as 'Absent'	Clicking the Clock In button twice rapidly creates two duplicate rows on the Admin's attendance list, showing conflicting attendance status. On the employee side, only the wrong 'Absent' row is visible.	Bug	The system should only allow one clock-in entry per day. After the first click, the button should become disabled. No duplicate rows should be created on the Admin or Employee side.	- Row 1: Clock-In and Clock-Out have the exact same time. Status is Absent. - Row 2: Shows Clock-In time, Clock-Out is blank "-". Status is Present. Only Row 1 (Absent) is visible. The Present row is hidden from the employee.		High				
	Attendance	Delete employee attendance	Deleted attendance from Admin panel still shows as 'Clocked In' on the Employee Portal	When an Admin deletes an employee's attendance for the current day, the system does not update the Employee Portal. The employee can still see their old clock-in time on their screen instead of a clean, reset state.	Bug	After the Admin deletes the attendance, the Employee Portal should update immediately. The old clock-in time should disappear, and the Clock In button should become active again so the employee can mark attendance if needed.	The attendance is deleted from the Admin side, but the Employee Portal still shows the old clock-in time. The employee cannot see that their attendance was removed		High				
	Attendance	Attendance	System marks early-departure as 'Short Leave' instead of 'Half-Day'	If an employee clocks on time but leaves very early (at 1:00 PM or 2:00 PM), the system incorrectly marks it as a Short Leave	Issue	The system should calculate total hours. If hours worked are equal to 50% of the shift, the status should automatically become Half-Day.	The system still leaves the status as Short Leave, allowing full-day credit for minimal hours worked.		Medium				
	Attendance	Add employee attendance	Missing validation allows Admin to manually mark attendance on Sundays or configured Holidays	There is no check or restriction on the Admin side to prevent manual attendance logging on official holidays or off-days. Even if Sunday or another date is configured as a Holiday, the Admin can still successfully mark an employee as present for that day.		The system should block the action or display a warning message like: "This date is configured as a Holiday/Off-Day. Are you sure you want to add attendance?" to prevent data entry mistakes.	The system allows the Admin to mark attendance on holidays smoothly without any validation check, block, or warning message.		Medium				
	Employee Portal	Attendance	Arriving after 9:10 AM marks employee as 'Late' instead of 'Half-Day'	The system does not apply the correct half-day rule when an employee clocks in after the 9:10 AM grace period. For example, if an employee clocks in at 1:00 PM, the system marks them as Late instead of automatically changing their status to Half-Day.		Any clock-in after 9:10 AM must strictly apply the half-day check and mark the employee's status as Half-Day.	The system only marks the employee as Late, ignoring the half-day rule restriction.		High				
	Employee Portal	Dashboard	Data is not synchronizing on the Employee Dashboard(holidays,present)	The Employee Dashboard does not update automatically or show correct real-time data. For example, when attendance is marked or leaves are changed, the dashboard still shows old information until a field manual refresh.		The Employee Dashboard should sync instantly. All counters, attendance charts, and summary numbers must show the latest and correct data without any lag.	The data does not sync. The dashboard displays outdated records or takes too long to load the new data from the database.		high				
	Employee Portal	Dashboard	Late' and 'Half-Day' statuses are excluded from Present Count and there is no separate counter cards	Currently, when an employee is marked Late or Half-Day, these days are not added to their total "Present Count". Furthermore, there are no separate summary cards on the dashboard to track Late arrivals or Half-Days.	Issue	1. Late and Half-Day should either be counted as part of the total "Present" days (since the employee did work), OR 2. The UI should have separate counter cards on the dashboard for Total Late Days and Total Half-Days so employees can track them clearly.	Late and Half-Day entries disappear from the main Present counter completely, and there are no dedicated cards to show these counts anywhere on the dashboard.		Medium				
			Projects											
	Project	Add Project Category	Implement inline error messages on 'Add Project Category' form validation	When a user tries to save a new project category with empty mandatory fields, the system should show clear, red inline error messages directly underneath the field instead of using a generic alert.	UI/UX Enhancement	The form should block submission and display clear, red inline text under each missing field (e.g., "Project category name is required").	There are no specific inline error messages highlighting which required fields are blank upon clicking save.		Low				
		Add project Category	Inconsistent button sizes and shadow effects on Save and Cancel buttons	The Save and Cancel buttons on the form lack visual symmetry. They do not have the same dimensions (size), and one button has a shadow effect while the other does not.	UI issue	Both buttons must have the exact same size for perfect symmetry. Additionally, the shadow style should match: either both buttons should have a shadow, or the shadow should be removed from both to keep the design flat and consistent.	The button sizes are mismatched, and there is a design asymmetry because one button displays a shadow effect while the other looks completely flat.		Low				
	Add Project	Add Project	Missing inline validation and generic 'failed to save' error on Add Project form	The Add Project form does not show inline error messages for blank inputs. Additionally, mandatory fields do not display a red asterisk (*), and saving an empty form triggers a generic error toast message instead of pointing out the empty fields.	UI Issue	1. Required fields must show a red asterisk (*) by default. 2. Clicking save on empty fields should show red inline messages under those fields (e.g., "Project Name is required").	No red asterisks or inline messages appear. Instead, the system shows a vague popup message "failed to save the record".		Medium				
		Add Project	Redesign 'Add Project' form for better visual symmetry	The 'Add Project' form needs a design update to improve user experience.					Low					
		Add project	Inconsistent button sizes and shadow effects on Save and Cancel buttons	The Save and Cancel buttons on the form lack visual symmetry. They do not have the same dimensions (size), and one button has a shadow effect while the other does not.	UI issue	Both buttons must have the exact same size for perfect symmetry. Additionally, the shadow style should match: either both buttons should have a shadow, or the shadow should be removed from both to keep the design flat and consistent.	The button sizes are mismatched, and there is a design asymmetry because one button displays a shadow effect while the other looks completely flat.		Low				
		App project	End Date' field saves empty values despite being marked as required (*)	The End Date field on the Add Project form shows a red asterisk (*), indicating it is a mandatory field. However, the system allows the user to save the project even if the End Date field is left completely blank.		The form should block submission, keep the page open, and display an inline error message saying "End Date is required".	The system successfully saves the record with an empty End Date, ignoring the validation rule.
